ABSTRACT

A memory card connector includes a main body and four sets of pins. The main body is integrally formed by way of plastic injection, provided with four sets of pin locating seats at the periphery thereof and has a socket opening at a side thereof for being inserted with four memory cards in different specifications. The socket opening provides multiple narrow recesses in different sizes and the narrow recesses partly overlap with each other. The four sets of pins are inset to the four pin locating seats respectively. The socket opening at two opposite lateral sides thereof extends inward a groove passage respectively and at the inner lower side thereof provides a fifth set of pin locating seats corresponding a fifth set of pins, which are used for correspond an XD card. The socket opening can be inserted with five different types of memory cards.
